Introduction

"History of geophysical institutes and observatories"

K. Arora, D. Cole, J. Urrutia Fucugauchi, and M. G. Johnson (guest editors)

Correspondence to: M. G. Johnson (magnar.g.johnsen@uit.no)

The establishment of research institutes and places to make precise observations and measurements of natural phenomena may be considered as fundamental for any civilized nation. From the advent of the industrial revolution, it was realized that precise measurements and the understanding of geophysical phenomena were needed in technological and cultural development. Therefore geophysical institutes and observatories have been established in most countries all over the world in order to aid weather and climate forecasting, navigation, communications, etc. Although the existence of geophysical observatories and institutes has much importance for the modern world, their value has been underestimated and few efforts of historic documentation have been attempted.

To bring necessary visibility and give credit where it is due, HGSS is now launching a new series – "History of geophysical institutes and observatories". Authors are hereby invited to submit manuscripts to the new series. Texts describing the history and significance of geophysical institutes and observatories, whether they be about the work of historic, prestigious and venerable, world famous or lesser known and modest institutions, either national or international, are all welcome.
